2004 International Sherwood Fusion Theory Meeting
Missoula, MT. April 26-28, 2004
Beyond the standard diffusive transport paradigm

• Recent experimental and theoretical evidence suggests that transport in magnetically confined plasmas deviates from the standard diffusion paradigm:

\[ \partial_t P = \partial_x \left[ \chi(x,t) \partial_x P \right] + S(x,t) \]

• Examples include:
  • Confinement time scaling of L-mode plasma
  • Fast propagation and non-local transport phenomena
  • Non-Gaussianity and long-range correlations of fluctuations
  • Anomalous diffusion and non-Gaussian pdfs in tracer transport studies
• The standard diffusion paradigm breaks down because it rests on restrictive assumptions including:

  • Space locality (Fick’s law)
    \[ Q = -\chi \partial_x P \]
    Flux depends on local quantities

  • Time locality (Markovian assumption)
  • Underlying “microscopic” un-correlated, Gaussian stochastic process (Brownian walk)

Our objective is to develop transport models that go beyond the restrictive assumptions of the standard diffusion paradigm.

The model is based on the use of fractional derivative operators that incorporate in a unified way non-Fickian transport, “memory effects” (i.e. non-Markovian transport) and non-Gaussian scaling.
Turbulence model

As a concrete case study to motivate and test the model, we consider transport in 3-D pressure-gradient-driven plasma turbulence.

\[
\left( \partial_t + \tilde{V} \cdot \nabla \right) \nabla^2_{\text{per}} \tilde{\Phi} = \frac{B_0}{m_i n_0 r_c} \frac{1}{r} \frac{\partial \tilde{p}}{\partial \theta} - \frac{1}{\eta m_i n_0 R_0} \nabla^2_{\parallel} \tilde{\Phi} + \mu \nabla^4_{\parallel} \tilde{\Phi}
\]

\[
\left( \partial_t + \tilde{V} \cdot \nabla \right) \tilde{p} = \frac{\partial \langle p \rangle}{\partial r} \frac{1}{r} \frac{\partial \tilde{\Phi}}{\partial \theta} + \chi_{\text{per}} \nabla^2_{\text{per}} \tilde{p} + \chi_{\parallel} \nabla^2_{\parallel} \tilde{p}
\]

\[
\frac{\partial \langle p \rangle}{\partial t} + \frac{1}{r} \frac{\partial}{\partial r} \left( r \langle \tilde{V}_r \tilde{p} \rangle \right) = S_0 + D \frac{1}{r} \frac{\partial}{\partial r} \left( r \frac{\partial \langle p \rangle}{\partial r} \right)
\]

Tracer transport

Focus on tracers following the $E \times B$ flow velocity

\[ \frac{d \dot{r}}{dt} = \frac{1}{B^2} \nabla \Phi \times \mathbf{B} \]

Initial condition: localized in radius, uniformly distributed in $z$ and $\theta$
Standard diffusion

Plasma turbulence

Probability density function

Gaussian

Non-Gaussian

Diffusive scaling $\nu = 1/2$

Anomalous scaling

super-diffusion $\nu \sim 2/3$

Moments

$\langle x^n \rangle \sim t^{n\nu}$

Model

$\partial_t P = \chi \partial_x^2 P$
What causes this non-diffusive transport?

$E \times B$ flow velocity eddies induce large tracer trapping that leads to temporal non-locality.

“Avalanche like” phenomena induce large tracer displacements that lead to spatial non-locality.

The combination of tracer trapping and flights leads to anomalous diffusion.

Tracer orbits
Continuous Time Random Walk Model

(Montroll-Weiss 1965)

\[
\begin{align*}
\tau_n &= \text{waiting time} \quad \psi(\tau) = \text{waiting time pdf} \\
\zeta_n &= \text{jump} \quad \lambda(\zeta) = \text{jump size pdf}
\end{align*}
\]

\[
P(x,t) = \delta(x) \int_0^\infty \psi(t') dt' + \int_0^t \psi(t-t') \left[ \int_{-\infty}^\infty \lambda(x-x') P(x',t') dx' \right] dt'
\]

Contribution from particles that have not moved during \((0,t)\)

Contribution from particles located at \(x'\) and jumping to \(x\) during \((0,t)\)

Solution in terms of Fourier-Laplace transforms

\[
\hat{P}(k,s) = \frac{1 - \tilde{\psi}(s)}{s} \frac{1}{1 - \tilde{\psi}(s) \hat{\lambda}(k)}
\]
Standard diffusive case

\[ \hat{P}(k,s) = \frac{1 - \tilde{\psi}(s)}{s} \frac{1}{1 - \tilde{\psi}(s) \hat{\lambda}(k)} \]

\[ \psi(\tau) \sim e^{-\mu \tau} \quad \text{Trapping pdf} \]
\[ \lambda(\zeta) \sim e^{-\zeta^2/2\sigma} \quad \text{Jumps pdf} \]

1/\mu and \sigma transport scales

Continuum limit
\[ s \hat{P} - 1 = -k^2 \hat{P} \]

Laplace transform
\[ L[\partial_t \hat{P}] = s \hat{P} - \delta(x) \]

Fourier transform
\[ F[\partial^2_x \hat{P}] = -k^2 \hat{P} \]
Non-diffusive case

\[ \hat{P}(k,s) = \frac{1 - \tilde{\psi}(s)}{s} \frac{1}{1 - \tilde{\psi}(s) \hat{\Lambda}(k)} \]

\[ \begin{align*}
\psi(\tau) &\sim \tau^{-(\beta+1)} & \text{Trapping pdf} \\
\lambda(\zeta) &\sim |\zeta|^{-(\alpha+1)} & \text{Jumps pdf}
\end{align*} \]

No characteristic transport scale \( \langle \tau \rangle \to \infty \quad \langle \zeta \rangle \to \infty \)

Continuum limit \( s^\beta \hat{P} - s^{\beta-1} \hat{\Lambda}(x) \)

Laplace transform \( L[\hat{P}] = s^\beta \hat{P} - s^{\beta-1} \delta(x) \)

Fourier transform \( F[\hat{P}] = -|k|^\alpha \hat{P} \)

There are no simple differential operators satisfying these relations
Fractional derivatives

Fractional space derivative

\[ \partial_{|x|}^\alpha P = c \left[ -\partial_x^\alpha + \partial_x^\alpha \right] P \]

\[ -\partial_x^\alpha P = \frac{1}{\Gamma(m-\alpha)} \partial_x^m \int_{-\infty}^{x} \frac{P(y)}{(x-y)^{\alpha-m+1}} \, dy \]

\( m - 1 \leq \alpha < m \)

Fractional time derivative

\[ \partial_t^\beta P = \frac{1}{\Gamma(1-\beta)} \int_0^t \partial_\tau P(\tau) \, d\tau \]

\[ L \left[ \partial_t^\beta \tilde{P} \right] = s^\beta \tilde{P} - s^{\beta-1} \delta(x) \]

\[ \partial_t^\beta P = \chi \partial_{|x|}^\alpha P \]

Fractional transport model
Local and non-local transport

Local diffusive transport

$$\partial_t P = \chi \partial_x^2 P = 6 \chi \frac{\langle P \rangle_L - P}{L^2}$$

as \( L \to 0 \)

Non-local fractional diffusive transport

$$\partial_t^{\beta} P = D \partial_{|x|}^\alpha P = c \partial_x \int_{-\infty}^x \frac{P(y)}{(x - y)^\alpha} dy + \mathbb{L}$$

\( \langle P \rangle_L(x) = \frac{1}{2L} \int_L^P P(x + s) \, ds \)

\( L = \text{“radius of influence”} \)
Initial value problem

\[ \partial_t^\beta P = \chi \partial_{|x|}^\alpha P \]

\[ \eta = x \ t^{-\beta/\alpha} \quad \text{Self-similar variable} \]

\[ \delta = \varepsilon \ t^{-\beta/\alpha} \quad \text{Small parameter} \]

\[ P(x, t) = t^{-\beta/\alpha} K(\eta) + O(\delta^2) \]

\[ K(\eta) = \frac{1}{\pi} \int_0^\infty \cos(\eta z) E_\beta(z^\alpha) \, dz \]

\[ E_\beta(z) = \sum_n \frac{z^n}{\Gamma(\beta n + 1)} \]

Gaussian

\[ \alpha = 2 \quad \beta = 1 \]

(asymmetric) Levy

\[ \alpha \neq 2 \quad \beta = 1 \]

\[ \alpha \neq 2 \quad \beta \neq 1 \]
What is $\alpha$?  
Space asymptotic scaling

$P(x, t_0) \sim x^{-(1+\alpha)}$

What is $\beta$?  
Time asymptotic scaling

$P(x_0, t) \sim \begin{cases} t^\beta & \text{for } t \sim 0 \\ t^{-\beta} & \text{for } t \to \infty \end{cases}$
Comparison with fractional model
Probability density function of tracers

$$\alpha = \frac{3}{4}, \quad \beta = \frac{1}{2}, \quad \chi = 0.09$$
Comparison with fractional model
Probability density function of tracers

\[ \alpha = \frac{3}{4}, \quad \beta = \frac{1}{2}, \quad \chi = 0.09 \]
Scaling of moments

\[ P(x, t) = t^{-\beta/\alpha} K(\eta) \quad \eta = t^{-\beta/\alpha} x \]

\[ \langle x^n \rangle = \int x^n P(x, t) \, dx = t^{n\beta/\alpha} \int \eta^n K(\eta) \, d\eta \]

\[ \langle x^n \rangle \sim t^{n\nu} \]

Standard diffusion

Turbulence model

Fractional diffusion model

\( \alpha = 3/4 \quad \beta = 1/2 \quad \nu = \beta / \alpha = 2/3 \)
Summary

• We have shown numerical evidence of non-diffusive transport in plasma turbulence.

• We proposed a fractional transport model that incorporates in a unified way space non-locality (non-Fickian transport), memory effects (non-Markovian transport), and anomalous diffusion.

• There is quantitative agreement between the fractional model and the turbulence calculations.

Where do we go from here?

\[ \partial_t^\beta P = c \left[ -\partial_x^\alpha + \partial_x^\alpha \right] P + F(P) + S \]

- Asymmetric fractional operators
- Nonlineratity
Asymmetric fractional transport of pulses

Superdiffusive spreading

pinch
Fractional diffusion and nonlinearity

Exponential decaying constant speed fronts

$\alpha = 2$

Algebraic decaying accelerated fronts

$\alpha = 1.25$
What is a fractional derivative?

\[
\frac{d^n f}{dx^n}
\]

L’Hopital (1695): “What if \( n = 1/2 \)?”

Leibniz (1695): “This is an apparent paradox from which, one day, useful consequences will be drawn”

It is a usual practice to extend mathematical operations, originally defined for a set of objects, to a wider set of objects

\[
\sqrt{r} \quad r \in \mathbb{R}^+ \quad \Rightarrow \quad \sqrt{s} \quad s \in \mathbb{R} \\
\Gamma(n) \quad n \in \mathbb{N}^+ \quad \Rightarrow \quad \Gamma(s) \quad s \in \mathbb{R} \\
\partial_x^n \phi \quad n \in \mathbb{N}^+ \quad \Rightarrow \quad \partial_x^\alpha \phi \quad \alpha \in \mathbb{C}
\]

This mathematical “games” have, eventually, important physical applications
Fractional integral

Integer order integration

\[ a \partial_x^{-n} \phi = \int_a^x dx_1 \int_a^{x_1} dx_2 \ldots \int_a^{x_{n-1}} dx_n \phi(x_n) \]

\[ a \partial_x^{-n} \phi = \frac{1}{(n-1)!} \int_a^x (x - y)^{n-1} \phi(y) \, dy \]

Riemann-Liouville fractional integral

\[ a \partial_x^{-\nu} \phi = \frac{1}{\Gamma(\nu)} \int_a^x (x - y)^{\nu-1} \phi(y) \, dy \]

Example:

\[ \partial_x^{-\nu} x^\mu = \frac{\Gamma(\mu + 1)}{\Gamma(\mu + \nu + 1)} x^{\mu+\nu} \]
Fractional derivative

\[ a \partial_x^\mu \phi = \frac{d^N}{dx^N} \left[ a \partial_x^{-\nu} \phi \right] \]

\[ \nu = N - \mu \]

\[ N = \text{smallest integer} > \mu \]

\[ a \partial_x^m \phi = \frac{d^N}{dx^N} \left[ a \partial_x^{(N-m)} \phi \right] = \frac{d^m}{dx^m} \phi \]

Riemann-Liouville fractional derivative

\[ a \partial_x^\alpha \phi = \frac{1}{\Gamma(2 - \alpha)} \partial_x^2 \int_0^x \frac{\phi(y)}{(x-y)^{\alpha-1}} \, dy \quad 1 < \alpha \leq 2 \]

Examples:

\[ 0 \partial_x^\mu x^\lambda = \frac{\Gamma(\lambda + 1)}{\Gamma(\lambda - \mu + 1)} x^{\lambda-\mu} \]

\[ -\infty \partial_x^\mu e^{ikx} = (ik)^\mu e^{ikx} \]
Relation to asymmetric Levy distributions

\[ \phi(x, t = 0) = \delta(x) \]

\[ \phi(x, t) = \frac{1}{2\pi} \int_{-\infty}^{\infty} \exp \left( i^\alpha k^\alpha D t + i k x \right) dk \]

\[ \tilde{\phi}(k, t) = \int_{-\infty}^{\infty} \phi(x, t) e^{-i k x} \, dx = e^{i^\alpha k^\alpha D t} \]

That is, the Fourier transform of the propagator of the fractional diffusion equation is the characteristic function of the extremal (asymmetric) Levy distribution \( L_{\alpha, \beta}(x) \) with

\[ 0 < \alpha < 2 \quad \beta = 2 - \alpha \]
Drift effect in fractional diffusion

Initial value problem \( \phi(x, t = 0) = \delta(x) \)

\(< x >= 0 \)

Sub-advection of peak concentration

\[ x_*(t) = V(\alpha) t^{1/\alpha} \]

\[ V = \left( \frac{\alpha + 1}{2\alpha} \right) \tan \left( \frac{\alpha \pi}{2} \right) \alpha \cos \left( \frac{\alpha \pi}{2} \right)^{1/\alpha} \]
Nonlocal transport

\[ \phi(x,t) = \int_{-\infty}^{\infty} dx' \ P(x-x';t) \ \phi(x',t=0) \]

\[ \lim_{x \to \infty} P \sim e^{-x^2} \]

local transport

\[ \lim_{x \to \infty} P \sim x^{-(1+\alpha)} \]

nonlocal transport

Due to the algebraic tail of the propagator, fractional diffusion leads to nonlocal transport
Nonlocal transport and global diffusive coupling

Grunwald-Letnikov definition

$$\frac{\partial^\alpha \phi}{\partial x^\alpha} = \lim_{h \to 0} \frac{\Delta_h^\alpha \phi}{h^\alpha}$$

$$\Delta_h^\alpha \phi(x) = \sum_{j=0}^{N} (-1)^j \binom{\alpha}{j} \phi(x - jh)$$

$$\frac{\partial^\alpha \phi_k}{\partial x^\alpha} \approx \left( \frac{\Delta_h^\alpha \phi}{h^\alpha} \right)_k = \frac{1}{h^\alpha} \sum_{j=0}^{k} w_j^\alpha \phi_{k-j}$$

Finite difference approximation

$$w_0^\alpha = 1 \quad w_j^\alpha = \left( 1 - \frac{\alpha + 1}{j} \right) w_{j-1}^\alpha$$

Global coupling coefficients

For $\alpha = 1$ and 2 usual nearest neighbor coupling of Laplacian operator
For $1 < \alpha < 2$ fractional diffusion implies global coupling
Reaction diffusion models of front dynamics

Fisher-Kolmogorov equation

\[
\frac{\partial \phi}{\partial t} = D \frac{\partial^2 \phi}{\partial x^2} + \gamma \phi (1 - \phi)
\]

diffusion \hspace{1cm} reaction

\[c = 2 \sqrt{\gamma D}\]

- L-H transition models
- Model of genes dynamics
- Model of logistic population growth with dispersion
- Other applications include combustion and chemistry.
The fractional Fisher-Kolmogorov equation

\[ \partial_t \phi = D \partial_x^\alpha \phi + \gamma \phi (1 - \phi) \quad 1 < \alpha < 2 \]

\[ -\infty \partial_x^\alpha \phi = \frac{1}{\Gamma(2 - \alpha)} \partial_x^2 \int_{-\infty}^{x} \frac{\phi(y)}{(x - y)^{\alpha - 1}} \, dy \]

The asymmetry in the fractional derivative leads to an asymmetry in the fronts

Self-similar dynamics, exponential tails, constant front velocity

Quasi-self-similar dynamics, algebraic tails, front acceleration
